The following list of material have been tested and are believed to be potential crater causing materials. This list is by no means all inclusive of material which may be used or present at each individual plant nor

does it necessarily indicate crater problems will result if the material is being used and present in the plant environment. Many materials if used properly and controlled in the process will not result in crater contamination even though it may test as a potential crater causing substance. The material must be present and in the right environmental conditions during the painting process to cause craters.

The purpose of this list is to inform plants as to potential crater causing materials and can be used as a guide should a crater contamination problem occur. This list will be continuously updated as additional materials are identified and tested for crater sensitivity.
